PROVINCIAL BOARD OF HEALTH,
VICTORIA, B.C., November 30th, 1938.

To His Honour E. W. HAMBER,
Lieutenant-Governor of the Province of British Columbia.

MAY IT PLEASE YOUR HONOUR:

The undersigned has the honour to present the Report of the Medical Inspection of Schools for the year ended June 30th, 1938.

G. M. WEIR,
Provincial Secretary.

REPORT ON MEDICAL INSPECTION OF SCHOOLS.

PROVINCIAL BOARD OF HEALTH,
VICTORIA, B.C., November 30th, 1938.

The Honourable G. M. Weir, M.A., D.Paed.,
Provincial Secretary, Victoria, B.C.

SIR,—Herewith I beg leave to hand you the Twenty-seventh Report of the Medical Inspection of Schools for the Province of British Columbia.

For twenty-seven years we have carried out this responsibility each year, and reported to the Minister of our Department the work which has been carried out in the Provincial Board of Health and, more particularly in this instance, of the enforcement and carrying-out of the provisions of the Medical Inspection of Schools Act.

Public-health practice is as old as society. In its modern form, however, it is a young branch of public administration. The major activities of local, Provincial, and Federal health agencies are of surprisingly recent development. Public-health practice in its modern form is a relatively young art. Its vitality is evident, however, not only from its accomplishments of the past, but also by the diversity of the professions which it has come to embrace. We have won and we hold the confidence of the public. The accomplishments of the past are notable and significant and they are greatly appreciated by society, but we cannot rest upon our oars and must admit that the accomplishments of the past in health conservation are secondary to the needs of the present and the future.

I am taking the liberty of quoting from a previous report in which I said: "Whilst the work in British Columbia has been, to an onlooker, probably slow, yet to those interested and to those who understand the difficulty of influencing the public opinion we can look back to a solid foundation upon which to build our future work, and the impetus that we have received from yourself, Sir, augurs well for the enlargement of the present work and brings to those immediately concerned the pleasant prospect of seeing your visions materialized."

We have been firmly imbued with the idea that results permanent in character can only be brought about by beginning with the child at its birth and following it, step by step, through different stages of education before entering school and then particularly after.

The space at my service in a report such as this is too short to enable me to give in detail from year to year the changes that are being brought about. But in looking back during the past twenty-seven years we have reason to be proud of the work which has been done, and more especially of the fact that our work has been studied, understood, appreciated, and put into force by public opinion.

We have increased our teaching facilities by bringing about coalescence in different parts of the Province, and I am very pleased to say that this year we have achieved remarkable results. This is particularly true of the Metropolitan Health Unit in and around the City of Vancouver, and also as shown by the work that is being carried out in the smaller places in the Province where we have more self-contained units.

In regard to the Metropolitan, I am taking the liberty of appending a report that we received from the Epidemiologist in charge of the work at the University Unit. I feel sure that a perusal of this, while not thoroughly understood altogether owing to its dealing with professional subjects, yet will serve to show the heights to which we are rising in the work in British Columbia when we compare this with the meagre reports of the schools when we began twenty-seven years ago. A short time in the growth of nations, but a growth that is shown by increased facilities which are being furnished to the people in British Columbia; also shown by the results of the work of our staff who have kept pace with modern developments and who have applied these in a way that has aided the health of the pupils under their care.

The health-work that is done in the schools is fitting into a niche in the general policy in your department, Sir, involving so much that applies to the mosaic of the principles you have laid down in regard to the inter-relation as between health and education.

Fortunately these results are noted and appreciated and approved by the people in general. Just a short time ago we had a comment from a teacher to the effect that the progress of the pupils is shown by the results of the treatment as regards health-work in connection with education, the brightness of the pupils, a greater interest is shown in their school-work and a higher standing attained from year to year.

One way to convince the people is by demonstration in a practical manner of the postulates that we are laying down. There are many angles of our work which would make very interesting reading, but space will not permit of our going into this as fully as should be done.

I referred in the last two Annual Reports of the Medical Inspection of Schools to the work which we have been doing in dentistry. This work has been neglected more than any other, through ignorance and through entire absence of the knowledge of what will happen to the child in after-life if they continue to neglect the teeth. We have used every effort to impress upon the people that, if the teeth are neglected, the child will suffer from chronic diseases as they grow to manhood or womanhood. In order to impress our arguments upon the people, we know the most convincing way is through demonstrations in a practical manner.

The people are most interested and more and more co-operative in regard to the dental-work. Their co-operation is shown by substantial cash contributions. Where we have gone into a district and cleaned it up makes it much easier to continue the work of prevention, and the benefits that have accrued to the children through the dental-work has opened up further avenues of which we are taking advantage.

The consolidation of our work which has been the growth of some years is bringing to the people a greater knowledge of the results of unanimity. Our Public Health Nursing Service is producing results that are very gratifying and it takes much less argument and talking when starting the work at new points than it did previously. Our strong point in carrying this work out is referring the people to districts where the work has been carried out or where it is being carried out.

Our school-work throughout the Province will have to be considered in probably a different aspect than we have in the past, and we will have to adopt a policy which will take in a greater number of the small schools. It is difficult to reach these. However, by consolidation of the schools we hope that in the near future we will be able to report much more favourable reception by the people.

Our full-time Health Units, presided over by a specially trained medical man, are accomplishing splendid results. The children are thoroughly examined, the nurses are with the doctor when such examinations are held, and we trust that the medical profession will look upon this school-work as something not only of great benefit to the recipients but that uniformity of principle in carrying it out will redound very much to the benefit of the medical men.

We are confident that recognition of this principle is largely responsible for the success of the work which we are carrying out in the Health Unit established for Vancouver and the surrounding districts, and which also embraces the University Area, and we would call your attention to the report which we are publishing in connection with this report and to which we have already referred.

We would ask the school officials, and particularly the parents who may have an opportunity of reading our report, to write us offering suggestions or complaints if necessary. In connection with the yearly medical examinations of the pupils we consider that the parents are much better able to describe the child's symptoms and we would urge that the parents do their best to be present at these examinations.

We are appending herewith a report from the Metropolitan Health Area in regard to the school-work. The work which is being carried on in Vancouver is comprehensive, thorough, and sufficiently staffed to enforce the regulations, and is the best evidence we have, together with the work in the University Area, of the thoroughness of the work on the part of the Provincial Board of Health in connection with the school service.

This report has been furnished to the Provincial Board of Health by Dr. Stewart Murray, Senior Medical Health Officer.

Details of the examination of each school follow.

I have the honour to be,

Sir,

Your obedient servant,

H. E. YOUNG, M.D.,

Provincial Health Officer.

REPORT OF THE METROPOLITAN HEALTH COMMITTEE, GREATER VANCOUVER.

I wish to report on some positive health activities carried on in the schools of the Metropolitan Area, above and beyond the statutory routine examinations.

Health Education.—The regular health teaching according to the curriculum is supplemented by health talks to pupils by the Medical Inspector at the time of physical examination, and also by talks given to classes by the school nurses. By precept and example, in all their activities the doctors and nurses maintain healthful ideals.

Parent Health Education.—Parents receive a written invitation to be present at the examination of the child on entering school. All matters pertaining to the health of the child, including immunization, are discussed with the parent. Frequent talks to Parent-Teacher Associations and other organizations are given by the school doctors and nurses.

First Aid.—First aid in cases of accident is given by school nurses and doctors when present at the school. A system of reporting all accidents to the Director of this division by the school principals is maintained.

In many schools, classes in first aid under the St. John Ambulance Association are conducted by the nurses, and the examination for diplomas are given by the school doctors.

Vaccination.—In November of each year all pupils are checked to see if the Provincial regulations have been carried out. At a certain date, those whose parents have not complied are excluded from school until this has been attended to.

Toxoid Clinics.—Toxoid clinics are held in each grade school every year. This is supplemented by weekly immunization clinics at each Health Centre.

Tuberculosis.—For several years parents of all beginners have been given the opportunity of having their children given the tuberculin test. All positive reactors receive an X-ray examination. A striking reduction in tuberculosis infection was found last year.

A beginning was made two years ago in the matter of tuberculin testing and X-raying high school pupils. This year, this work is to be much extended and preliminary preparations are now being made. This tuberculosis work is done with the co-operation of the Provincial Tuberculosis Division.

Epidemiology in the Schools.—All cases of communicable diseases are reported to the Division of Epidemiology and all possible assistance given. Printed instructions in detail are placed in each class-room for the guidance of teachers.

Goitre Prevention.—Each year all pupils under twelve years of age are examined for enlargement of the thyroid gland and preventive treatment in the form of a chocolate tablet containing ten milligrams of iodine given weekly by the school nurse to those having no enlargement. A charge of 10 cents per year is made to cover cost of tablets. Striking reduction in the incidence of goitre has been accomplished in the past nine years.

Supervision of Athletics.—Each high school pupil taking part in the major athletics are examined yearly and their fitness determined by the school physician.

School Dental Services.—Free dental treatment is given only to those whose parents cannot pay for such treatment. Service extends to all grades from one to eight, and emergency service only to high school pupils. At present there are two dental clinics, two full-time and two half-time dentists, and two dental assistants.

Sight-saving Classes.—In Vancouver City there are two sight-saving classes under the supervision of the School Health Division. The junior class accommodates pupils in the first six grades, and the senior class those in grades seven, eight, and nine.

These classes give an opportunity for education to pupils with vision too poor to allow them to attend the ordinary classes. The teachers are specially trained in this work and the rooms specially arranged for accommodation of these classes.

Lip-reading Classes.—A start has been made to relieve those with permanently defective hearing by the opening of three lip-reading classes in the Vancouver schools, under a teacher well qualified in this work.

Mental Hygiene.—For the past two years, a physician specially trained in mental hygiene has been engaged in this work and co-operating with the Bureau of Measurements. At present we have no mental hygienist, but a new appointment is to be made shortly.

Sanitary Supervision.—Monthly reports on sanitary conditions in all schools are received from the nurses, and medical officers investigate any unsatisfactory conditions. A general survey of lighting and ventilation in all schools is now being prepared.

Examination of Teachers.—Last season a chest examination including X-ray was made of all teachers in the Metropolitan Area. Burnaby having joined the Metropolitan Committee this year, the survey is now being conducted in that area. All new teachers are now given an X-ray as well as a clinical examination.

Physical Status Classification.—For some years it has been considered that the classification of pupils under par was not satisfactorily expressed by the terms "Malnutrition" and "Under Average Weight." We have therefore tried to classify pupils under the headings "A," "B," and "C." For those in the lower categories it was sought to give a reason for their being so classified.

Under "A" are placed those in generally good state of health. "Ad" expresses a good state of health though a defect is present which does not affect general health.

Under "B" those whose health is moderately impaired. If it is considered that such impairment is due to some defect in the pupil himself, he is classified "Bd"—the "d" expressing the presence of a defect.

If the impairment is considered due to some condition outside the pupil himself, such as poor home environment and poor health habits, the pupil is classified "Be."

"Cd" and "Ce" show health much impaired due to defect or environment respectively.

Impairment due to both physical defect and environment is shown as "Bde" or "Cde."

A health record of each pupil is kept on an individual card and this record follows him throughout his school-life. This is very useful to medical officers, nurses, and teachers in following the tendencies to good or poor health throughout school-life, and the influence exerted by corrections of defects and environment.

Respectfully submitted.

HAROLD WHITE,
Director of School Health Division, Metropolitan Health Committee.

ELEVENTH ANNUAL REPORT OF THE UNIVERSITY HEALTH SERVICE, UNIVERSITY OF BRITISH COLUMBIA.

FOR THE TERM 1937–38.

The University Health Service exists for the purpose of preventing disease and supervising and promoting health among the students. It is, in fact, the local health department.

The service is carried out in the following manners:—

1. Control of the spread of communicable disease is practiced by the well-known principles of reporting, isolation, examination, and segregation of contacts and immunization.

2. Each new student is given a complete physical examination on entrance to the University.

3. Each student, as a result of his or her physical examination, is classified according to the strenuous athletics in which he may safely participate.

4. Physical defects are pointed out to the student by a "follow-up" system of personal conferences, both at and following the physical examination. Treatment is recommended where necessary.

5. Health habits are taught the student during the examination and by lectures, posters, and pamphlets, and personal discussions throughout the year.

6. The Health Services are available for first-aid and health advice to any student who chooses to visit the full-time Public Health Nurse. The Medical Officer has specified office hours throughout the term for consultation with students.

7. Preventive vaccinations and inoculations are given by the Medical Officer at specified times.

CHANGE OF STAFF.

Mrs. Celia A. Lucas was on leave of absence from May, 1937, and found it convenient to retire from the service at the end of the 1938 spring term. She has devoted many unselfish years to the cause of public health in British Columbia. In the fall of 1927 she was appointed Public Health Nurse to this service and this marked the commencement of the continuous operation of a full-time local health department. On her rested the difficult task of initiating the work, establishing routines and record systems which have eased the work of her successors. Her genuine interest in the students and her conscientious devotion to duty have left her many appreciative friends and colleagues. We wish her many happy years and trust that in her retirement she may find an interesting outlet for her energies and talents.

Mrs. Lucas was succeeded by Miss Muriel Upshall, formerly Public Health Nurse in the Richmond Sub-unit of the Metropolitan Health Area. She entered her new duties with enthusiasm and executed them this year to our entire satisfaction.

Through the generosity of the Provincial Board of Health, sufficient money was granted to employ a clerk for the busiest times of the year, and she was on duty till March 31st.

The divisions of the health services are as follows:—

(1.) Examination of the well.
(2.) Communicable disease control.
(3.) Follow-up.
(4.) Out-patient service.

(1.) EXAMINATION OF THE WELL.

This year, for the first time in the history of this department, the physical examinations of new students were finished by October 31st. This was possible because of the spacious quarters in the University Endowment Lands Office where three examiners could work at one time. The physicians attached to the Metropolitan Health Committee assisted the Medical Director in this work. Each student was given a complete examination and individual records are kept.

Eight hundred and forty-one students were examined this year compared to 752 in the 1936–37 session and 677 in the 1935–36 session.

Table No. 1 shows the number of students examined according to year and faculty.

Number of Students Examined.

Students with no defects, 12 per cent.

Tuberculin testing and X-ray Examination for Tuberculosis.

Because tuberculosis is the greatest cause of death among people of college age we decided to make a concerted effort to limit this disease among our students. To commence our anti-tuberculosis programme this year we offered each new student a tuberculin test and subsequent X-ray of the chest of all positive reactors. From November 22nd to 26th, inclusive, we tuberculin-tested 283 persons who presented themselves. We found 75 per cent. of these students showed positive tuberculin tests. Seventy per cent. of students between the ages of 16 and 23 years showed positive tests. This is considerably higher than the surveys of other Universities on this Continent which averaged about 30.5 per cent. positive.

Table No. 2 shows the results of the tuberculin survey according to age, compared to those from 11 colleges throughout the United States covering 14,364 students.

Results of Tuberculin Survey, according to Age-groups.

Age.	16.	17.	18.	19.	20.	21.	22.	23.	24–30.	30–40.	Forestry Lab.

Diagnostic X-ray Report.

Far-advanced tuberculosis	1
Healed tuberculosis	8
Tuberculosis suspect	1
Silicosis	1
Chronic bronchitis	1
Other diagnosis	35
Negative	173
Total	220

Following on our tuberculosis survey more tuberculin tests were done because of contact with known cases and persons presenting suggestive symptoms. Table 3 shows the results of all the tuberculosis investigation. It is seen that 340 persons were tuberculin-tested and four definite active cases of tuberculosis were found. Besides this were three cases showing calcified parenchymal nodes that required further observation. Fifteen with hylar and peribronchial markings of previous disease now healed. Thirty-three had other diagnosis of the chest, not tuberculosis, but such as bronchitis, bronchiectasis, old pleurisy.

Results of Examinations and Tests for Pulmonary Tuberculosis.

Tuberculin survey in the fall of all students who were examined and wished the test. Five per cent. had had the test previously. Positive reactors received an X-ray.

Tuberculin tests and X-ray of students who were in contact with a case of pulmonary tuberculosis.

Tuberculin tests of students showing symptoms.

	Tuberculin Tests.			X-ray.	Results of X-ray.			
	No. Stud.	Pos.	Neg.	Without O.T.	T.B. Case.	Neg.	Cont.	Recheck.
Fall survey	275	202 (75%)	66	17	1	210	1	10
Forestry laboratory	9	9	----	----	----	8	9	1 (Silicosis)
Contacts	40	31	9	5	----	36	36	36
Nurses	10	10	----	13	1	20	1	2
Symptoms, etc.	6	5	1	----	2	3	----	1
	340	255 (75%)	76	35	4 (1.3%)	296 (95.4%)	38	50 (Without Contacts 3.3%).

Follow-up of students who had X-ray of the chest the previous session—

Contacts	2
Suspects (1 discharged)	3

Diagnostic report—

Far advanced	1
Moderately advanced	2
Minimal—apparently arrested	1
Calcified parenchymal nodes	3
Hylar calcification	16
Silicosis	1
Hylar and peribronchial markings	15
Pleurisy—old	2
Bronchitis	1
Other diagnosis	33
Negative	213 or 73.4%

It is to be expected that those students coming from urban areas would show a higher percentage of positive reactors because of their greater opportunities for contact. That this is true is shown in Table No. 4 which gives the results of tuberculin tests according to locality. This does *not* include nurses and those showing symptoms.

Results of Tuberculin Tests according to Locality.

	Vancouver.	Other Urban.	Total Urban.	Rural.
Number	168	35	203	116
Percentage positive	79%	85.7%	80.7%	63.3%
Percentage negative	21%	14.3%	19.3%	36.7%

Laboratory Examinations.

As part of the complete physical examination given each student a urinalysis is done in our laboratory. Blood tests for leucocyte counts, differential counts, hæmoglobin content are done where indicated. The Provincial Laboratory are very generous in providing bacteriological and serological tests that the Health Service requires from time to time. Without their help the work would be severely handicapped. The statistical report on the activities of the Health Service, shown below, records 934 routine urinalysis done in this office. This alone is a large volume of work entirely done by ourselves.

(2.) COMMUNICABLE DISEASE CONTROL.

This year has been a fortunate one as far as communicable diseases among the students was concerned. The following show the number of cases reported:—

	Cases.
Chicken-pox	4
Communicable conjunctivitis	1
Dysentery	1
Epidermophytosis	2
Impetigo	1
Mumps	4
Rubella	3
Scarlet fever	2
Tuberculosis	4
Scabies	1
Pneumonia	4

Chicken-pox broke out in the Anglican College in March, but was limited to four cases, although there were ten susceptibles under observation. There were only two cases of scarlet fever amongst the students, although an epidemic of several hundred cases prevailed in the city in the early part of 1938. As mentioned above, there were four cases of active tuberculosis found.

To estimate the value of the Health Service in the prevention of communicable diseases, one sees from the following table that 53.8 per cent. of all our students give a history of not having had mumps or chicken-pox; 88.8 per cent. have not had rubella; and 87 per cent. have no history of scarlet fever.

Table No. 5 shows the percentage of students susceptible to certain communicable diseases.

Disease.	Students examined, 1937–38 (846).		Other Students (1,370).		All Students (2,216).
	No.	Per Cent.	No.	Per Cent.	Per Cent.
Chicken-pox	294	46.9	750	53.9	53.8
Diphtheria	45 or 5.3%	.....	43 or 3.2%	.....	.....
Measles	725	14.3	1,114	18.7	17.1
Mumps	397	53.1	633	53.9	53.8
Rubella	106	87.5	144	89.5	88.8
Scarlet fever	120	85.9	169	85.5	87.0
Smallpox	12 or 1.5%	18.8	22	22.6	21.2
Vaccinated	675 or 79.7%	.....	1,039 or 75.8%	.....	.....

No. is the number of students that have had the disease.
Per cent. is the percentage of students that are susceptible to the disease.

Immunizations.

The Health Service found that 21.2 per cent. of the 2,216 students this year gave no history of smallpox vaccination. During the year sixty-nine smallpox vaccinations were done. Other immunization procedures were done from time to time as conditions required them. They are shown below. We feel that in the future more preventive inoculations should be given this highly susceptible group of people and will attempt to build up this part of our programme.

(3.) "FOLLOW-UP" SERVICES.

All students who had major or minor physical defects were interviewed either during the examination or by appointment with the Medical Director later. Many students had minor defects, such as flat feet, poor posture, or acne, which required little time. In all, however, only 12 per cent. of students were found to be without some physical defect. Of the women examined, 43 per cent. required follow-up for correction of defects or further investigation. Of the men 46 per cent. required follow-up for these reasons.

In general the response of the students to the follow-up notices was good. Two hundred and fifty-three reported to the office regarding defects found on physical examination. Actually 122 subsequently informed us that they had received treatment from their own physicians and had the defect corrected. An example of the response is shown in the following:—

Of 103 person requiring dental treatment, 48.5 per cent. reported having had this done.

Of 51 with defects of vision we know that 73 per cent. were corrected by treatment.

The follow-up services include also a great amount of work in tracing and isolating communicable disease cases and contacts, bringing these persons up for examination and immunization where possible. The number of such investigations are shown on the statistical report of the activities for the session 1937–38.

(4.) OUT-PATIENT SERVICE.

For the first-aid treatments there were 781 visits. Consultations with the Medical Director numbered 301, and on 995 occasions students were given health advice by the nurse.

Morbidity among Students.

The following table shows the number of persons availing themselves of the services offered and the percentage of students who seek health advice. It is seen that 20 per cent. of all the students sought health advice voluntarily. In addition, 11 per cent. of all the students came on request because of physical defects or of being communicable-disease contacts.

Use of the Health Service by Students.

	Of all Students.		Of Students examined, 1937–38.		Of Students not examined, 1937–38.	
	No.	Per Cent.	No.	Per Cent.	No.	Per Cent.
Students seeking health advice	443	20	186	22	180	13
Total number of individuals reporting (other than for examination)	706	31	410	50	271	19

Actually, 2,183 visits were made by 568 students who received out-patient services, or 2.2 visits per student.

To obtain an idea of the incidence of various types of illness and the resultant loss of time, Table No. 6 presents the number of office visits by the sick, classified according to the diagnosis.

Office Visits and Days lost through Illness, classified as to Diagnosis.

Diseases.	Visits.	Seen by M.H.O.	No. Cases Absent.	No. School-days lost.

Totals	1,605	212	230	1,564

Time lost through Illness.

This table shows that 230 students were known to be absent because of illness and they lost a total of 1,564 school-days. In addition, three cases of tuberculosis each lost a whole term.

Public Health Education.

The Medical Director gave a series of lectures to a group of women as part of a course on Health Habits and Physical Exercise arranged by Miss Moore, of the Department of Physical Education.

A talk and moving-picture film on medical subjects was given to the premedical group in February.

Miss Upshall lectured twice to a group of about twenty women on general health.

During the year several hundred pamphlets were distributed personally at the Health Service Offices. Posters were used and casual instruction given by all the staff at opportune times during the medical examinations in the fall.

Sanitation and Examination of Food-handlers.

One of the duties of the Health Service is the supervision of campus sanitation.

Periodic inspections of toilets, wash-rooms, showers, and gymnasia have been carried out. Certain changes in the provision of foot-baths in the gymnasium were made during the fall, and as a result we have had a low incidence of epidermophyton infection of the feet.

A survey of lighting in the library was carried out with the co-operation of Mr. Lee, the Superintendent of Buildings, and Mr. Riddington, the Librarian. New lighting was placed in the " corrals " where the illumination was found to be most inadequate.

The cafeteria has regular sanitary inspection by the Medical Director and nurse. All employees receive a complete physical examination with blood tests and X-ray examination of the chest. The full staff of thirteen were each examined this year. The new dish-washing and sterilizing equipment in the cafeteria are great advantages in the sanitary handling of the food here.

Report of the Summer Session, 1938.

The Health Service provided the same facilities as was initiated in the summer of 1937. The nurse was on duty each school morning and the Medical Director was available for consultation by appointment.

The number of students taking advantage of the services offered was double that of last year. The following table shows the statistical details of the services rendered:—

No. of staff and students visits to office	99
No. of staff and students reporting	35
Health advice given	57
First-aid treatments	51
Re tuberculosis	3
Re vaccination	1
Referred to Medical Director	5
Referred to private physicians	2
Students interviewed and examined by Medical Director	5
Consultation, Medical Director	3
No. students weighed	12
No. students' eyes tested	1
Typhoid inoculations—	
No. doses	4
No. completed	1
Laboratory specimen obtained	1
Medical certificate to Deans	1
Business calls	5
Home visits	2

New Needs of the Health Service.

One of the most obvious health requirements of the student-body is some provision for advising and guiding the student who shows definite social maladjustment. This includes those who show early signs of schizophrenia, anxieties, and worries. Those students who left college because of " nervous breakdown " or who were handicapped during the year by neurotic symptoms, were usually recorded at the time of their entrance examination as requiring psychiatric guidance and treatment. It is difficult to convince these students of the need for treatment because few of them have an insight into their own mental aberrations. Universities with more personnel on their Health Service have found the appointment of a psychiatrist to their staff to be most fruitful in the prevention of mental morbidity. His services are for the guidance and treatment of those students who require such special care.

Another need often felt is some means of obtaining treatment for sick students who refuse to call a physician because they cannot pay him. We often wish for a " sick fund " which might meet such emergencies.

I would take this opportunity of gratefully acknowledging the interest that the Deans of each Faculty have taken in the work of the Health Service. The co-operation of the members of the Faculty and the appreciation of the student-body have been most encouraging.

We are glad to enjoy a closer working arrangement with the Department of Physical Education, whose purposes are in sympathy with our own.

For me the year has been most enjoyable, and the work has been greatly aided by the loyal, unselfish co-operation of my colleagues of the Metropolitan Health Committee Staff.

All of which is respectfully submitted.

K. F. Brandon,
Director, University Health Service.
