

# Physical Function in Breast Cancer Survivors: A systematic review of published values

# Nishikawa, K., Chu, J. Y., Lam, J. B., Lo, K. K., Sy, V. S. & Campbell, K. L. University of British Columbia Masters of Physical Therapy

function in breast cancer survivors in

physical function in breast cancer survivors – difficult

Aim: Provide a summary of published values of physical function in breast cancer survivors and identify gaps to provide direction for future research

### Introduction

### **Background Information**

cancer in Canada<sup>1</sup>

- 5-year survival rate 88% in Canada<sup>1</sup>
- Growing population of cancer survivors left with long
- Declining physical function common in women who have undergone treatments<sup>3</sup>

Domains of physical function included **lower extremity** strength, upper extremity strength, aerobic fitness, balance, and mobility

### **Study Design**

**Intervention** - Any type of treatment (no treatment, chemotherapy, radiation, medications, etc.) or

populations determined by the authors of this review a priori

### Methods

### Data sources and searches

- Five independent search strategies for five aspects of physical function
- Same terms for breast cancer survivors for all searches combined with specific terms for each component of physical function

### Databases used:

- Medline (1990 to present + In-process & Other Non-Indexed Citations)
- Embase (1990 to present, daily update)
- CINAHL (1990 to present)
- Limited to English and human studies

Duplicates taken out with

Refworks "Surgery" not explicitly searched

### **Study selection**

### Exclusion criteria:

- Did not report data of females, who were 18 years of age or older and were breast cancer survivors
- Did not provide the outcome measure of interest
- Did not report the baseline data
- If the studies were not observational, cohort, case control and random clinical trials
- Not published between 1990 and February 28<sup>th</sup>, 2012

Relevant values are included if they are retrieved from a search within another aspect of physical function

### **Data extraction**

- Data extracted include: age, publication information, values of outcome measures of interest
- Only baseline values of original studies were extracted
- Values were calculated if original studies reported only postintervention values and percentage of change

Quality of the papers were not assessed, as primary objective of the study is to report values of physical function at baseline

### **Quality Assessment**

### 1-RM (predicted) – Leg Press 1-RM (NA)\* – Leg Press

**Physical Function** 

Endurance – Leg Press Sit to Stand – Time for 5 repetitions Sit to Stand – Repetitions in 30 seconds Dynamometer – Leg Extension

1-RM (measured) – Leg Press

### **Upper Extremity Strength – Total Studies**

**Lower Extremity Strength – Total Studies** 

Dynamometer - Handgrip Dynamometer – Others 1-RM (measured) – Bench Press 1-RM (measured) – Shoulder Press 1-RM (measured) - Seated Row 1-RM (predicted) – Shoulder Press 1-RM (predicted) – Seated Row

### 1-RM (predicted) – Bench Press Endurance – Bench Press

### **Aerobic Fitness – Total Studies** VO<sub>2</sub> max

- Measured VO<sub>2</sub> Max (maximal test) - Measured VO<sub>2</sub> Max (submaximal test) - Predicted VO<sub>2</sub> Max (maximal test)

- Predicted VO<sub>2</sub> Max (submaximal test) Resting Heart Rate 6-Minute Walk Test

12-Minute Walk Test

## Power Output

**Balance – Total Studies Timed Backward Tandem Walk Sensory Organization Test** 

- Somatosensory

- Visual

 Vestibular - Preference

- SOT5: - SOT6: One Legged Stance – Eyes open or Eyes closed

## Fullerton Advanced Balance Scale **Mobility – Total Studies**

Functional Independence Measure		
Timed Stair Climb (Ascend)		
Timed Stair Climb (Descend)		
Time Required to get up from floor		
Time Required to get down to floor		

**Short Physical Performance Battery** Normal Gait Speed

of life and rehabilitation in breast cancer treatment. The Netherlands Journal of Medicine. 2009; 67(6): 220-225.

Fast Gait Speed Timed Up and Go Test

## \*1-RM (NA): Methods not defined as measured or predicted

### Results

<u># of</u> Studies	Range of values	Normative Values
18		
4	73.02 - 99.3 kg	<u>-</u>
4	24.4 - 134.8 kg	<del>_</del>
2	60.40 - 84.4 kg	<u>-</u>
3	10.1 - 16.9 reps	<u>-</u>
3	7.53 - 12.6 s	11.4 s (60-69 y.o.)
3 2	10 - 13.6 reps 27.3 - 27.7 peak torque/BW; 69.1 - 72.1 kg	15 reps (60-64 y.o.) -

40.4s / 7.4s (40-49 y.o.)

1.10 m/s (50-59 y.o.) 1.47 m/s (50-59 y.o.) 8.1 s (60-99 y.o.)

## - One study measured 1-RM in kg/kg of bodyweight, but

are measured in different units<sup>4</sup>

values were extraordinarily high<sup>5</sup>

- Most common outcome measure **1-RM leg press** 

of body weight) for aged 40-49, 50-59, and 60+4

- Normative values are 1.18, 1.05, and 0.99 (units=kg/kg

- Cannot compare normative values to literature as they

- Sit to stands are also commonly used (two types)
- Repetitions in 30s: Lower than healthy population

**Discussions** 

### **Upper Extremity Strength**

**Lower Extremity Strength** 

- Most common outcome measure handgrip strength
- Weaker handgrip strengths compared to age-matched healthy women<sup>6</sup>
- Other measures of upper extremity strength are also decreased<sup>7</sup>
- Proximal UE movements are more common in recent studies to predict UE strength

### **Aerobic Fitness**

- **VO2 max** measurements mostly scored below 25<sup>th</sup>
- Resting heart rate elevated
- **6MWT** falls within range of healthy population<sup>8</sup>

### **Balance**

- Single legged stance was longer than the normative
- Fullerton Advanced Balance Scale score lower than healthy control (36.48.) but still above cut off for the risk of falls, which is equal or below 25<sup>11</sup>

### **Mobility**

- Timed-up-and-go (TUG) test faster than norms, but age of the population is younger<sup>11,12</sup>
- Decreased gait speed (normal and fast) despite walking for shorter distance<sup>13</sup>
- Mixed results for ascending/descending stairs<sup>13,14</sup>

### Limitations

- Search strategy and methods may not have captured all relevant papers
- Specific outcome measures for physical function were identified a priori - some appropriate outcome measures may have not been included
- Studies had varying methods for the same outcome
- Lack of normative values for some of the selected outcome measures and normative values vary by age

### **Data Analysis**

- Relevant characteristics of the studies
- Values of physical function reported
- Outcome measures identified for each domain of physical function
- Normative data in healthy and clinical populations identified in the literature if available
- No statistical techniques were utilised

## Conclusion

- Upper extremity strength and aerobic fitness values reported in breast cancer survivors are significantly lower than normative values
- Lower extremity strength, mobility, and balance measures are less conclusive
- More consistent outcome measures needed in the future to assess mobility and balance

# The primary objective of this review is to examine the published values of physical

- Limited data on normative or expected values of

## In 2012, 22,700 women will be diagnosed with breast

- term effects of the disease and its treatments<sup>2</sup>

**Population** - Females  $\geq$  18 y.o. diagnosed with breast

combination Outcomes - Primary outcome measures chosen are most commonly used among the healthy or clinical
